Definition

A power series about x = 0 is a series of the form

$$\sum_{n=0}^{\infty} c_n x^n = c_0 + c_1 x + c_2 x^2 + \dots + c_n x^n + \dots = f(x)$$
s about $x = a$ is a series of the form

A power series about x = a is a series of the form

$$\sum_{n=0}^{\infty} c_n(x-a)^n = c_0 + c_1(x-a) + c_2(x-a)^2 + \cdots + c_n(x-a)^n + \cdots$$

in which the center a and the coefficients $c_0, c_1, c_2, \cdots, c_n, \cdots$ are constants.

When we fix a value for x, say x = 1, the power series

$$\sum_{n=0}^{\infty} c_n x^n = c_0 + c_1 + c_2 + \cdots + c_n + \cdots$$

is an infinite series whose convergence or divergence can be investigated.

For
$$x = 2$$
, the power series $\sum_{n=0}^{\infty} c_n x^n = c_0 + 2c_1 + 4c_2 + \cdots + 2^n c_n + \cdots$.

If for an x, the series $\sum_{n=0}^{\infty} c_n x^n$ converges we can use the limit of partial sequences to define a function f at x.

- We will see that a power series defines a function f(x) on a certain interval where it converges.
- Finding this interval of convergence is important. Moreover, this function will be shown to be continuous and differentiable inside the interval.

$$x = 1, \quad \begin{cases} x = 1 \\ 1 + x + x^2 + x^3 + x^4 + \dots + x^n + \dots$$

Geometric Power series

Let us consider some familiar power series.

$$\sum_{n=0}^{\infty} x^n = 1 + x + x^2 + x^3 + x^4 + \dots + x^n + \dots$$

This is the geometric series with first term 1 and common ratio x. It converges to $\frac{1}{(1-x)}$ for |x| < 1. We express this fact by writing

$$\frac{1}{1-x} = 1 + x + x^2 + x^3 + x^4 + \dots + x^n + \dots, -1 < x < 1.$$

We think of the partial sums of the series on the right as polynomials $P_n(x)$ that approximate the function on the left.

$$P_1(x) = 1$$

 $P_2(x) = 1 + x$
 $P_3(x) = 1 + x + x^2$
 $P_n(x) = 1 + x + x^2 + \dots + x^n$

Consider the power series

$$f(x) = 1 - \frac{1}{2}(x - 2) + \frac{1}{4}(x - 2)^{2} + \dots + (-\frac{1}{2})^{n}(x - 2)^{n} + \dots$$

$$0 = 1$$

$$0 = -\frac{1}{2}(x - 2)$$

$$0 = -\frac{1}{2}(x$$

Consider the power series

$$1 - \frac{1}{2}(x-2) + \frac{1}{4}(x-2)^2 + \dots + (-\frac{1}{2})^n(x-2)^n + \dots$$

This is a geometric series with first term 1 and ratio $r = -\frac{(x-2)}{2}$. The series converges for

$$\left|\frac{x-2}{2}\right| < 1$$

which simplifies to 0 < x < 4. The sum is $\frac{1}{1-r} = \frac{2}{x}$. Thus

$$\frac{2}{x} = 1 - \frac{1}{2}(x-2) + \frac{1}{4}(x-2)^2 + \dots + (-\frac{1}{2})^n(x-2)^n + \dots, 0 < x < 4.$$

The Convergence Theorem for Power Series

$$\sqrt{2} = \frac{1}{2} = \frac{1}{2}$$

Theorem

If the power series

$$\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n + \dots$$

converges at $x = c \neq 0$, then it converges absolutely for all x with |x| < |c|. If the series diverges at x = d, then it diverges for all x with |x| > |d|.

Radius of convergence (= convergence (>c-a) < R

Definition

The radius of convergence of the series $\sum a_n(x-a)^n$ is a positive number

R such that the series diverges for x with |x - a| > R but converges absolutely for x with |x-a| < R. The series may or may not converge at either of the endpoints x = a - R and x = a + R.

Remarks.

- If the series converges absolutely for every x, then $R=\infty$.
- ② If the series converges at x = a and diverges elsewhere, then R = 0.

The interval of radius R centered at is called the interval of convergence.

$$(a-R,a+R)$$

$$(a-R,a+R)$$
 on $[a-R,a+R)$ on $[a-R,a+R]$

How to calculate R?

- Use ratio test or root test to find R such that in |x-a| < R, the power series $\sum_{n=0}^{\infty} a_n(x-a)^n$, converges.
- Check for the convergence at |x a| = R to conclude if R also a part of interval of convergence.

For what values of x the power series $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^n}{n}$ converge?

- $\bullet \lim_{n\to\infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n\to\infty} \left| \frac{x^{n+1}}{n+1} \cdot \frac{n}{x^n} \right| = \lim_{n\to\infty} \frac{n}{n+1} |x| = |x|.$
- By the Ratio Test, the series converges absolutely for |x| < 1 and diverges for |x| > 1.
- At x=1, we get the alternating harmonic series $1-\frac{1}{2}+\frac{1}{3}-\cdots$ which converges.
- At x=-1, we get the harmonic series $1+\frac{1}{2}+\frac{1}{3}+\cdots$ which diverges. Thus $\sum_{n=1}^{\infty}(-1)^{n-1}\frac{x^n}{n}$ converges for $-1< x \leq 1$ and diverges elsewhere.

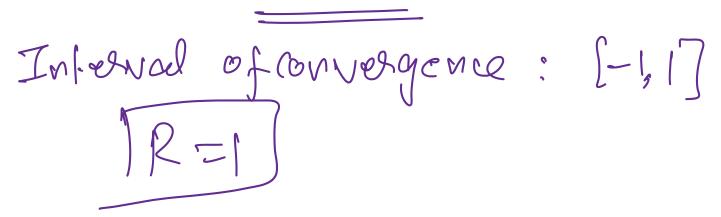

Interval of convergence = (-1,1)

For what values of x the power series $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^{2n-1}}{2n-1}$ converges? $= |x|^2 = 9$ $(onverges <math>|x|^2 < 1 \Rightarrow -12x < 1$ duages $1501^2 S1 \rightarrow 500 \in (-\infty, 1) \cup (100)$

For what values of x the power series $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^{2n-1}}{2n-1}$ converges?

- By the Ratio Test, the series converges for $x^2 < 1$ and diverges for $x^2 > 1$.
- At $x = \pm 1$, the alternating series converges.
- Thus the series converges for $-1 \le x \le 1$ and diverges elsewhere.

For what values of x the power series $\sum_{n=1}^{\infty} \frac{x^n}{n!}$ converges?

For what values of x the power series $\sum_{n=1}^{\infty} n! x^n$ converges?

By ratio test,
$$\left|\frac{a_{n+1}}{a_n}\right| = \left|\frac{(n+1)!x^{n+1}}{n!x^n}\right| = (n+1)|x| \to \infty$$
 except for $x = 0$. The series diverges for all values of x except at $x = 0$.
